

COMS3011A Lab 1

Third-Party Code

Tyra Mohamed

August 4, 2026

1 Introduction

This document lists the third-party libraries and packages used in the development of the COMS3011A Lab 1 Todo Application. Each dependency is accompanied by a brief explanation describing why it was chosen.

2 Third-Party Libraries

Library / Package	Reason for Use
Next.js	Provides the React framework used to build the application. It handles routing, page rendering and server actions.
React	Used to build reusable user interface components throughout the application.
TypeScript	Adds static type checking, improving code reliability and making the project easier to maintain.
Prisma ORM	Provides a safe and simple way to communicate with the SQLite database without writing SQL queries directly.
SQLite	Stores all task data locally on the user's computer, allowing information to persist after the application is closed.
Tailwind CSS	Used to style the application quickly using utility classes and to create the pastel user interface theme.
Lucide React	Provides modern SVG icons used throughout the application, including the calendar icon shown in the task creation form.

Library / Package	Reason for Use
Vitest	Runs the automated tests included with the project. It provides a fast testing framework for verifying application behaviour.

3 Summary

The selected libraries were chosen because they work well together within the Next.js ecosystem and satisfy the functional requirements of the assignment. Prisma and SQLite provide reliable local data persistence, Tailwind CSS simplifies interface development, and Vitest ensures that important application behaviour is tested automatically.
