

COMS3011A Lab 1

Running the Application

Tyra Mohamed

August 4, 2026

1 Introduction

This document explains how to install, configure and run the Todo application from a clean clone of the GitHub repository.

Following these instructions will create the SQLite database, install all required dependencies, start the application and run the automated tests.

2 Software Requirements

Before starting, install the following software:

- Node.js (Version: **v24.14.1**)
- npm (installed with Node.js)
- Git

3 Clone the Repository

Clone the GitHub repository.

```
git clone https://github.com/tyracodes/coms3011a-lab1.git
```

Move into the project folder.

```
cd coms3011a-lab1
```

4 Install Dependencies

Install all required packages.

```
npm install
```

5 Generate the Prisma Client

Generate the Prisma client.

```
npx prisma generate
```

6 Create the SQLite Database

Create the local SQLite database.

```
npx prisma db push
```

This command creates the SQLite database if it does not already exist and applies the database schema.

7 Run the Application

Start the development server.

```
npm run dev
```

Open the application in a web browser.

```
http://localhost:3000
```

8 Run the Automated Tests

Run all automated tests.

```
npm test
```

The project includes automated tests that verify important application behaviour such as task creation, archiving and overdue task detection.

9 Stopping the Application

To stop the development server, return to the terminal and press:

```
Ctrl + C
```

10 Summary

Following the commands in this document allows a user to install, configure and run the Todo application from a clean clone of the repository. The SQLite database stores task information locally, ensuring that data persists after the application is restarted.
